No level of lead in the blood is safe. In 2012, the CDC established a new reference value of (5 mcg/dl), thereby lowering the level at which evaluation and intervention is recommended by the CDC.

Note: Confirm elevated blood lead levels 5 µg/dL. A ‘confirmed’ elevated blood lead level (EBLL) is defined as a single elevated venous test 5 µg/dL or two elevated capillary tests within 84 days/12 weeks. A venous sample is required for environmental investigations. Virginia regulations require reporting of blood level 5 µg/dL s (using the EPI-1 form) to the Office of Epidemiology. Regulations 12 VAC 5-120 require laboratories and point of care providers using CLIA-waived devices to report all blood lead tests on children under the age of six within ten days of analysis.

MANAGEMENT OF CHILDREN WITH CONFIRMED ELEVATED BLOOD LEAD LEVELS

Current CDC management recommendations adapted from Managing Elevated Blood Lead Levels Among Young Children: Recommendations from the Advisory Committee on Childhood Lead Poisoning Prevention (CDC 2002). *Investigations may be required where babies or multiple children in a household have elevated blood lead levels. Follow-up care is described in more detail in the VDH “Care Coordination Manual: Children with Lead Poisoning in Virginia”.

Emergency Lead Healthcare Information Line
TOLL FREE EMERGENCY  (866) 767-5323
(866) SOS-LEAD

Note: For questions related to your local area, refer to your local health department. Local health policy and lead ordinances may have additional requirements. Richmond City has a lead ordinance that requires an investigation at 10 µg/dL. Developed by the Virginia Department of Health Lead Elimination Plan Medical Committee, following CDC Guidelines and Virginia Regulations. Funded by the Centers for Disease Control and Prevention and the Virginia Department of Health. Revised May 2009. (Last updated 12/2015)
Lead Questionnaire

Blood lead levels shall be obtained in children at ages 1 and 2 if they meet ANY one of the criteria noted below. In addition, children ages 3-5 years of age who have not previously been tested and meet ANY one of the criteria below shall also be tested.

1. Eligible for or receiving Medicaid, or WIC benefits? ____

2. Living in a ZIP code determined to be high risk based on age of housing and other factors? (Appendix 1) ____

3. Living in or regularly visiting a house or day care center built before 1950? ____

4. Living in or regularly visiting a house built before 1978 with peeling or chipping paint or recent (within the last 6 months), ongoing or planned renovation? ____

5. Living with or regularly visiting a sibling, housemate, or playmate with lead poisoning? ____

6. Living with an adult whose job or hobby involves exposure to lead? (Check all that apply)
   ___Radiator repair  ___Battery Manufacture or repair  ___Welding
   ___Housing renovation  ___Making pottery  ___Chemical preparation
   ___Stained glass w/ lead solders  ___Valve/pipe fittings  ___Going to a firing range
   ___Brass/Copper/Foundry  ___Smelting  ___Refinishing furniture
   ___Burning lead painted Wood  ___Casting ammunition, fishing weights, or toy soldiers
   ___Automotive repair shop  ___Bridge, tunnel and industrial machinery and equipment

7. Living near an active lead smelter, battery-recycling plant, or other industry likely to release lead? __________

8. Have any other members of the family had elevated blood lead levels? ____

9. Is your child a refugee? _____

10. Is your child’s history unknown? __

These Guidelines are promulgated by Sentara Health Plan (SHP) as recommendation for the clinical management of specific conditions. Clinical data in a particular case may necessitate or permit deviation from these Guidelines. The SHP Guidelines are institutionally endorsed recommendations and are not intended as a substitute for clinical judgment.
What You Should Know
Childhood Lead Poisoning

Low levels of lead in the blood can affect IQ cause learning disabilities, behavioral problems, and at very high levels, seizures, coma, and even death. The effects of lead exposure are not reversible.

How Are Children Exposed to Lead?
Major sources of lead exposure among U.S. children are lead-based paint and lead-contaminated dust found in deteriorating buildings and housing built before 1978.

Other sources of lead poisoning include:

- Home health remedies (i.e. arzacon, greta, pay-loo-ah),
- Some imported candies (specifically those from Mexico),
- Imported toy jewelry and make up.
- Drinking water (lead pipes, solder, brass fixtures, and valves can all leach lead),
- Work (recycling or making automobile batteries), and
- Hobbies (making stained-glass windows, pottery). Imported items including clay pots

Those at risk include children:

- Under the age of 6 years
- Living at or below the poverty line
- Live in older housing built before 1978
- Some racial and ethnic groups

Preventing Lead Poisoning
The key to protecting children from lead exposure is to prevent lead exposure before it happens by keeping children from coming into contact with lead and treating children who have been poisoned by lead.

- Identify and safely remove all lead hazards.
- Parental guidance and education on lead poisoning
- Test and treat for lead poisoning as needed

Decrease your exposure to lead by:

- Getting your child (ren) tested if you are concerned about a possible lead exposure.
- Getting your home tested for lead if you live in a house or apartment built before 1978, especially if young children live with you or visit you.
- Damp-mop floors; damp-wipe surfaces; and frequently wash a child’s hands, pacifiers, and toys
- Avoid using home remedies and cosmetics that contain lead (i.e. arzacon, greta, pay-loo-ah, kohl, alkohl)
- Children and pregnant women should not eat candies imported from Mexico.
- Use cold water from the tap for drinking, cooking, and making baby formula.
